Clinical Significance :-

The stool occult (hidden) blood test (SOBT) is a test used to check stool (feces) samples for hidden blood or blood products that may arise due to small amount of bleeding in the gastrointestinal disorders such as colitis, polyps, diverticulitis and hookworm infestations. Stool occult blood tests are recommended for use as an aid to routine physical examinations for screening of gastrointestinal bleeding from any source including colorectal cancer. A positive result means that the test has detected blood. This does not mean you have tested positive for cancer or any other illness. It's just an indication of internal bleeding which will require a formal evaluation of the patient's gastrointestinal tract. Physician may request colonoscopy or endoscopy to examine to examine the entire lining of the gastro-intestinal tract. False Positive result: A false positive reaction may occur if the stool containing peroxidase-like substances. Such reactions may be avoided by dietary restrictions. Further testing and examinations should be performed by the physician to determine the exact cause and source of the occult blood in the stool. A false negative reaction may be obtained if the stool contains a high concentration of ascorbic acid. If the test is negative but there is high clinical suspicion, two further specimens should be tested to detect bleeding which may be intermittent.

Please correlate with clinical conditions.
